

Tracking progress in reducing maternal mortality towards 2030

Brief

A mother and her child at the postnatal ward at Prey Khmer Health Clinic in Cambodia. © WHO / Yoshi Shimizu

The Sustainable Development Goals (SDGs) were launched on 25 September 2015 and came into force on 1 January 2016 for the 15-year period until 31 December 2030 – the day when all the targets should be reached (1). SDG target 3.1 is to reduce the global MMR to less than 70 maternal deaths per 100 000 live births by 2030 (2). Anticipating the launch of the SDGs, the World Health Organization (WHO) and its partners released a consensus statement and strategy paper in 2015 on ending preventable maternal mortality (EPMM) (3). In order to reach the global target, the EPMM statement urged all countries to reduce MMR by at least two thirds of their 2010 baseline level by 2030, setting a supplementary national target that by 2030 no country should have an MMR greater than 140. Recommended country targets are also provided; see Box 1.

The global MMR in 2023 – published in 2025 – was estimated by the United Nations Maternal Mortality Estimation Inter-Agency Group (MMEIG) at 197 (80% uncertainty interval [UI] 174 to 234) maternal deaths per 100 000 live births (2). The average annual rate of reduction (ARR) in the global MMR between 2000 and 2023 was approximately 2.2% (UI 1.4% to 2.8%), although progress was uneven throughout this period, and progress stagnated between 2016 and 2023, when the average ARR was just 1.6%. An average ARR of 14.8% in the MMR for the remaining seven years of the SDG period (2024–2030) is now required to achieve SDG target 3.1. If the recent pace continues without acceleration, the global MMR can be expected to reach 177 in 2030 – two and a half times higher than the SDG target.

With only five years to the end of the SDG period, there is an urgent call to intensify efforts and renew commitments to ending preventable maternal mortality, not only to ensure survival but also to improve the health and well-being of women during pregnancy and childbirth. Addressing disparities in health care access and quality, ensuring universal health coverage, strengthening health systems to cater to women's needs, and ensuring accountability for care quality and equity are paramount. Protecting sexual and reproductive rights and addressing gender inequalities are essential if we are to accelerate progress. New EPMM coverage targets introduced in 2021, supplemented by global, national and subnational EPMM indicators, emphasize the imperative of enhancing maternal health care coverage and empowering women to make informed decisions about their sexual and reproductive health (see Box 2) (4).¹

This brief presents the latest MMR estimates for the 195 countries and territories for which the MMEIG has produced and published estimates in 2025 (2), as well as the recommended EPMM national targets for 2030 (3) (see Table 1). Setting national MMR targets for 2030 is critical to drive efforts towards ending preventable maternal mortality. With little time now remaining to meet the SDG targets, it is crucial to urgently intensify coordinated efforts, and reinvigorate global, regional, national and community-level commitments to end preventable maternal mortality.

¹ In 2021, EPMM and ENAP (Every Newborn Action Plan) released joint coverage targets and were merged and renamed EWENE (Every Woman Every Newborn Everywhere) in 2024. The EWENE coverage targets are under revision for the period 2026–2030.

Box 1. Ending preventable maternal mortality (EPMM) global and national targets for reducing maternal mortality by 2030, from 2010 baseline

EPMM global target: By 2030, every country should reduce its MMR by at least two thirds from the 2010 baseline, and the average global target is an MMR of less than 70 maternal deaths per 100 000 live births.

EPMM supplementary national target: By 2030, no country should have an MMR higher than 140 maternal deaths per 100 000 live births (twice the global target).

EPMM country targets for equity at the country level:

- For countries with an **MMR less than 420 in 2010** (the majority of countries worldwide): reduce the MMR by at least two thirds from the 2010 baseline by 2030.
- For countries with an **MMR greater than 420 in 2010**: the rate of decline should be steeper so that in 2030, no country has an MMR greater than 140.
- For all countries with **low baseline MMR in 2010**: achieve equity in MMR for vulnerable populations at the subnational level.

Source: WHO, 2015 (3).

Box 2. Five clearly defined coverage targets for 2025

The EPMM initiative has established new global, national and subnational coverage targets that need to be achieved by 2025 if the SDGs are to be met. The global targets are:

- 90% of pregnant women to have four or more antenatal care contacts;
- 90% of births to be attended by skilled health personnel;
- 80% of women and newborns to access postnatal care within two days of childbirth;
- 60% of the population to have access to emergency obstetric care facilities that are within two hours of travel time;
- 65% of women make their own informed and empowered decisions regarding sexual relations, contraceptive use and reproductive health care.

Source: WHO, 2021 (4). Refer to this publication for the national and subnational targets and other milestones.

Table 1. Maternal mortality ratios (MMRs) estimated by the United Nations Maternal Mortality Estimation Inter-Agency Group (MMEIG) for the years 2010, 2015, 2020, 2023 by country, and corresponding recommended EPMM national targets for 2030. Shading on rows indicates countries where the “baseline” MMR in 2010 was greater than 420. Country targets were calculated based on this distinction

^a A total of 195 countries and territories (193 WHO Member States plus Puerto Rico and the occupied Palestinian territory, including east Jerusalem) met the inclusion criteria, as detailed in the most recent report of estimates by the United Nations Maternal Mortality Estimation Inter-Agency Group (MMEIG), published in 2025 (2).

^b The numbers in this column are the EPMM recommended national targets for MMR reduction based on each country's 2010 baseline MMR value; see also Box 1 (3).

^c The occupied Palestinian territory, including east Jerusalem, is a member in the Regional Committee for the WHO Eastern Mediterranean Region.

^d WHO Associate Member.
